DANG HUYNH SON

Backend Developer

+84 859758016 sondanghuynh@gmail.com https://github.com/huynhsown Thu Duc City, Ho Chi Minh City

CAREER OBJECTIVE

- Leverage expertise in Java and Spring Boot to design scalable, high-performance backend systems.
- Build robust APIs, optimize data processing pipelines, and deliver measurable results for complex applications.
- Implement reliable, maintainable software solutions, applying CI/CD practices within agile teams.
- Continuously expand technical skills in modern backend technologies to create solutions that enhance user experience.

EDUCATION

Ho Chi Minh City University of Technology and Education 09/2022 - Present

Major: Information Technology

GPA: 3.45/4

WORK EXPERIENCE

TMA Solutions 08/2025 - 11/2025

Backend Developer Intern

- Fixed REST/API and database issues, stabilizing stock and warehouse data flows.
- Supported debugging across Channel, Order, and Goods services, improving integration and error handling.
- Implemented warehouse and POS-related backend features, improving business logic reliability.

CERTIFICATIONS

TOEIC 690 05/2025

SKILLS

Backend	Java, Spring Boot, Spring Security (JWT, RBAC), REST API, WebSocket
Database	PostgreSQL, MySQL, Redis, JPA / Hibernate, Flyway, Elasticsearch
Tools	Git, GitHub, IntelliJ IDEA, Maven, Swagger (OpenAPI), JUnit, Postman
Soft Skills	Teamwork, Problem-solving, Adaptability

PROJECTS

FOODIEDASH 12/2025 - Present

Position: Full-stack Developer (Backend-focused)

Tech: Java, Spring Boot, Spring Security (JWT, RBAC), JPA/Hibernate, Redis, Elasticsearch, WebSocket (STOMP), PostgreSQL, Flyway.
Team size: 1.
Description:

- Designed backend using Clean Architecture to separate application layers, resulting in improved maintainability and scalability.
- Built secure APIs using Spring Security, JWT, and role-permission authorization to enforce access control, resulting in reduced unauthorized access risks.
- Implemented core business logic using Spring Boot to handle key modules, resulting in a clear and maintainable application flow.
- Developed real-time features using WebSocket to push order status updates.

- Optimized performance using Redis caching to reduce database queries, resulting in improved response time under high load.
- Integrated Elasticsearch to enable full-text search and filtering, resulting in faster and more relevant search results.
- Integrated payment gateway with secure transaction flow and callback handling to verify payments, resulting in reliable and consistent payment processing.
- Managed persistence using JPA/Hibernate and Flyway to handle data access and schema versioning, resulting in consistent and reliable database management.
- Implemented a CI/CD pipeline using Jenkins and Docker to automate build, test, and deployment to VPS, improving release consistency and reducing manual effort.

VIETJAY AIRLINES 03/2025 - 6/2025

Position: Backend Developer

Tech: Java, Spring Boot, Spring Security, JPA/Hibernate, Redis, PostgreSQL, Docker, GitHub Actions, Jenkins.
Team size: 2.
Description:

- Designed database schema using JPA/Hibernate to model flights, bookings, and passenger data, resulting in structured and maintainable data management.
- Developed RESTful APIs using Spring Boot to handle flight search, booking, and passenger management, resulting in a scalable and organized backend system.
- Implemented authentication and role-based access control using Spring Security to secure API endpoints, resulting in controlled access for different user roles.
- Used Redis to manage session state and reduce database load, resulting in improved system performance and faster response time.
- Integrated payment gateway with a secure transaction flow to handle online payments, resulting in reliable and safe booking operations.
- Built CI/CD pipeline using GitHub Actions, Jenkins, and Docker to automate build and deployment to VPS, resulting in faster and more consistent releases.
